What is a lithium titanate battery?

A lithium-titanate battery is a modified lithium-ion battery that uses lithium-titanate nanocrystals, instead of carbon, on the surface of its anode. This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the anode quickly.

Is lithium titanate a good anode material for lithium ion batteries?

Lithium titanate ($\text{Li}_4\text{Ti}_5\text{O}_{12}$) has emerged as a promising anode material for lithium-ion (Li-ion) batteries. The use of lithium titanate can improve the rate capability, cyclability, and safety features of Li-ion cells.

What are the disadvantages of lithium titanate batteries?

A disadvantage of lithium-titanate batteries is their lower inherent voltage (2.4 V), which leads to a lower specific energy (about 30-110 Wh/kg) than conventional lithium-ion battery technologies, which have an inherent voltage of 3.7 V. Some lithium-titanate batteries, however, have a volumetric energy density of up to 177 Wh/L.

What are the latest developments in lithium ion batteries?

Zhang Q, Li X (2013) Recent developments in the doped- $\text{Li}_4\text{Ti}_5\text{O}_{12}$ anode materials of Lithium-ion batteries for improving the rate capability. *Int J Electrochem Sci* 8:6449 Robertson AD, Trevino L (1991) New inorganic spinel oxides for use as negative electrode materials in future lithium-ion batteries. *J Power Sources* 81-82:352

Do lithium-ion batteries have a lifetime comparison?

Second, lifetime comparisons of lithium-ion batteries are widely discussed in the literature, (3-8) but these comparisons are especially challenging due to the high sensitivity of lithium-ion battery lifetime to usage conditions (e.g., fast charge, temperature control, cell interconnection, etc.).

Is niobium doped lithium titanate a high rate anode material?

Tian BB, Xiang HF, Zhang L, Li Z, Wang HH (2010) Niobium doped lithium titanate as a high rate anode material for Li-ion batteries. *Electrochim Acta* 55:5453 Qiu C, Yuan Z, Liu L, Ye N, Liu J (2013) Sol-gel preparation and electrochemical properties of La-doped $\text{Li}_4\text{Ti}_5\text{O}_{12}$ anode material for lithium-ion battery. *J Solid State Electrochem* 17:841

This gives the anode a surface area of about 100 square meters per gram, compared with 3 square meters per gram for carbon, allowing electrons to enter and leave the anode quickly. Also, the redox potential of Li^+ intercalation into titanium oxides is more positive than that of Li^+ intercalation into graphite. This leads to fast charging (hi...
