

What is Bess augmentation?

BESS augmentation is the process of adding battery capacity as the system ages. The timing of augmentation can be affected by the amount of system capacity overbuilt on the front end of a project. Every time a battery is cycled, its capacity and efficiency slightly decreases.

Does Bess operation affect battery degradation?

The proposed sizing algorithm iteratively evaluates the effect of BESS operation on battery degradation and estimates the cash flows of the power plant. In addition, we studied battery augmentation that adds the storage capacity in the base system to sustain the BESS capacity throughout the project planning horizon.

What foundation options should be considered in a Bess project?

A variety of foundation options should be preliminarily designed and reviewed, such as driven piles, helical piles, concrete grade beams, slabs, and drilled piers. The sample site layout below will give you an idea of how these site plan considerations may impact a BESS project. Sample site layout for illustrative purposes. Check local standards.

Proper planning is critical to minimise downtime and risks associated with augmentation. As prices continue to fall, augmentation is becoming an increasingly attractive way for developers to mitigate battery degradation and capacity loss.

A project's size, functionality and operating conditions can all impact how soon batteries will need energy augmentation -- it could be one year, five years, or much further down the road. A decision on whether or not to design an energy storage system for augmentation is based on several variables, including a project owner's preference.

As we continue to see investment in renewable energy, BESS will grow further in popularity and feasibility. Adding BESS to your solar or wind site can save money, improve reliability, and have positive impacts on the environment.

Augmentation: What is it and why is it important to BESS? Augmentation is the action of making something greater in size. For battery energy storage systems, this means increasing the battery's energy capacity.
