

Can centralized wind-PV hybrid power plants be used in Brazil?

Large scale wind energy in Brazil began in 2009, and hundreds of new wind farms have been installed since then. Large scale solar PV energy had an initial milestone in 2014, signalling that the technology can grow as much as wind energy. This study demonstrated the great potential for the deployment of centralized wind-PV hybrid power plants.

Are wind and solar energy potentials high in Brazil?

Wind and solar potentials are high in Brazil and are being recently explored. There are geographic location coincidences and wind-solar energy complementarity. Currently, there are no specific policies for hybrid energy projects in Brazil. Wind-solar development points to the advantages of combined centralized generation.

Is centralized hybrid generation possible in Brazil?

This work aims to present wind and solar photovoltaic energy development and its regulatory framework in Brazil, and demonstrate the potential for centralized hybrid generation. Official studies, research reports, and thematic maps were consulted, and two pilot hybrid plants were studied.

Are wind and solar photovoltaic energy development possible in Brazil?

Wind and solar energy have stood out in recent years because of the growth of global installed capacity. This work aims to present wind and solar photovoltaic energy development and its regulatory framework in Brazil, and demonstrate the potential for centralized hybrid generation.

What is the onshore generation of wind and solar energy in Brazil?

Abstract The onshore generation of wind and solar energy is a reality in Brazil. There are approximately 700 projects generating wind energy in the Northeast and South regions and 4000 generating solar energy distributed throughout the country.

Why does Brazil need a hybrid energy system?

In Brazil, there is a need for more renewable electricity generation; great potential for hybrid projects due to the complementarity of resources, and great potential for hybrid projects due to the established higher performance and synergy of such projects. The current regulatory framework does not support hybrid projects.

This study aims to evaluate the complementarity of offshore wind and solar energy along the Brazilian coastline by assessing the theoretical and technical potential of the resources. Wind and solar radiation hourly data of the ERA5 reanalysis are used from 1990 to ...

The main objectives of this work are: demonstrate the expansion potential of wind and solar energy in Brazil, the complementarity of these resources in specific regions, and consequently, the potential for wind-solar

hybrid plants; and examine the current national renewable energy generation regulatory framework and provide recommendations for ...

Brazil's government-run energy agency Empresa de Pesquisa Energética has conducted a study to assess the country's potential for hybrid solar-wind power installations. EPE's study intended ...

This paper aims at facilitating the developments of solar photovoltaic (PV) power and wind power generations to reduce carbon emission and achieve the carbon neutralization. The main novelty of this ... Expand

This study demonstrates that the Northeast Region of Brazil is conducive to HES projects; there are two pilot hybrid power plants in the Northeast, and that wind-solar PV hybrid power plants can be one innovative option for national energy security.

thematic maps and the presentation of two pilot projects of hybrid power plants. The preliminary results indicate that there is great potential for the realization of future centralized hybrid ...

The objective of this work is to show the panorama of wind and solar energy in Brazil and demonstrate its undeveloped strategic potential for centralized combined generation of electricity.

thematic maps and the presentation of two pilot projects of hybrid power plants. The preliminary results indicate that there is great potential for the realization of future centralized hybrid generation, combining wind and solar photovoltaic energy sources in several regions of Brazil, especially in the Northeast Region, with an

This paper evaluates the benefits of hybridizing a plant using an AI-based methodology for optimizing the wind-solar ratio based on the Brazilian regulatory system. For this study, the hybrid plant was modeled using data ...

results verify that there is still no specific regulation of wind-solar hybrid power plants in Brazil, but indicate that there is potential for implementing this type of enterprise, especially in the ...

results verify that there is still no specific regulation of wind-solar hybrid power plants in Brazil, but indicate that there is potential for implementing this type of enterprise, especially in the Northeast region.

This paper evaluates the benefits of hybridizing a plant using an AI-based methodology for optimizing the wind-solar ratio based on the Brazilian regulatory system. For this study, the hybrid plant was modeled using data collected over a period of 10 months.
