

Is energy decentralization a priority in Portugal?

Energy decentralization is already a priority for the country. In Portugal, community energy initiatives were relatively common in the early 20th century, associated with small hydropower plants and local electricity distribution networks.

Do community energy initiatives still exist in Portugal?

In Portugal, community energy initiatives were relatively common in the early 20th century, associated with small hydropower plants and local electricity distribution networks. However, with the progressive centralization of the electricity production system throughout the 20th century, community solutions lost relevance.

Can decentralization improve the integration of renewables?

Decentralization has been talked about for decades but, as markets seek to rapidly integrate more renewables and improve grid flexibility, it is encouraging that now, with stronger regulatory support, we are beginning to see real progress. For countries to reach net zero, the integration of renewables must improve significantly.

What is the transition from centralized grid networks to decentralized distributed energy?

The global transition from centralized grid networks to decentralized distributed energy systems is accelerating. From microgrids, small-scale renewables, and combined heat and power facilities, to distributed energy storage and controllable loads, a plethora of options is emerging.

Although decentralized generation presently represents a low weight in national generation, storage systems can contribute to limit the fluctuating availability to solar and wind ...

According to DGEG data: between 2016 and 2021, decentralized installed power increased by 66% and photovoltaic UPAC increased by around 90%. The use of UPAC from non-solar sources was almost non-existent.

Although decentralized generation presently represents a low weight in national generation, storage systems can contribute to limit the fluctuating availability to solar and wind energy, promoting the development of local grids, and increasing the resilience and flexibility of the energy system.

In Portugal, in recent years, we have seen a substantial increase in the decentralized production of electrical energy, mainly from solar sources. In fact, in 2021 we had a total installed capacity ...

This paper gives a brief account of what has been made in Portugal in this area and shows the results of a special Power Quality (PQ) campaign launched by EDP Distribui  o (EDPD) to estimate the effects of this new decentralized power on some of the main PQ indicators of its low voltage grids.

To promote Hydrogen, Portugal approved the National Hydrogen Strategy (EN-H2) in 2020. The EN-H 2 has as main objective to introduce an element of incentive and stability for the energy sector, promoting the gradual introduction of hydrogen as a sustainable pillar and integrated in a more comprehensive strategy of transition to

Since 2014, the PV market in Portugal has been dominated by self- consumption projects with publishing of the Decree-law 153/2014 that promotes the installation of small scale units (until 1 MW) for prosumers and small and medium-sized

The PV installed capacity tends to increase under decentralized generation, bearing also in mind the national and European context. o DL 153/2014 was a very important step for the decentralized generation promotion, increasing greatly the efficiency ...

The long-term goals presented in the Roadmap for Carbon Neutrality (RNC) are more ambitious with regard to the decentralization and democratization of electricity generation, foreseeing an installed capacity of 12 to 13 GWp of decentralized solar photovoltaic generation in 2050 5. Furthermore, and according to the different scenarios presented ...

Portugal has made great progress in implementing renewable energy systems (RES) to use its endogenous renewable resources. As the cost of renewable energy generation is decreasing, mainly for photovoltaic energy, a significant increase in its

In Portugal, in recent years, we have seen a substantial increase in the decentralized production of electrical energy, mainly from solar sources. In fact, in 2021 we had a total installed capacity of 580.46 MW and in 2023, until October, we have an installed capacity of 1,769.21 MW of decentralized electricity production.

Since 2014, the PV market in Portugal has been dominated by self- consumption projects with publishing of the Decree-law 153/2014 that promotes the installation of small scale units (until ...

More than 80% of decentralized power production is currently produced by cogeneration plants. From the beginning of 20th century, steam-condensing power systems and small hydro systems, running in island operation, were the main electricity suppliers to the first industrial plants in Portugal, namely in the paper and textile sectors.
