The thermal power is removed in normal operation by 8 spiral-bound tube bundle steam generators located in the upper part of the primary vessel to enhance natural circulation in case of loss of primary pumps. In Fig. 1 it is shown a scheme of ELSY reactor with the circulation paths and free levels in nominal power condition (Cinotti et al., 2007).

This paper presents the current status of development of ELSY - European Lead-cooled System - a pool-type lead-cooled 600 MWe fast reactor, under development since September 2006, within the Sixth EURATOM Framework Programme.

The ELSY project demonstrates the possibility of designing a competitive and safe fast critical reactor using simple engineered technical features, while fully complying with the Generation IV goal of sustainability and minor actinide (MA) burning capability. ... This power must be removed from the core and the primary system in a reliable way ...

Since in normal operation they are to be positioned outside the active core, FAs characterized by the lowest power (i.e., power distribution factor lower than 1.2) - and therefore not requiring any flattening by regulation FARs - have ...

Lead is chemically inert and has good neutronic characteristics that are unique among the coolants for a fast reactor. The ELSY project aims at the demonstration that it is possible to design a competitive and safe fast power ...

The overall core layout, mostly defined by complying with mechanical and seismic constraints, has been optimized in order to obtain a flatten (up to 1.2 maximum-to-average ratio) power/Fuel Assembly (FA) distribution.

The paper presents the overall work carried out in the ELSY project in the frame of EU-FP6 related to the development of a conceptual design of an Industrial size LFR. The presentation follows strictly the ELSY project work package organization highlighting the main features of the proposed design.
