How much energy does a wind turbine produce?

A range of 1.8-90 kWhof energy can be produced by a wind turbine, depending on its energy capacity and size. The table below shows energy output generated by wind turbines of different power capacities: How much energy does a 500W wind turbine produce? 9 kWh per day as the actual output.

What voltage does a wind turbine use?

A modern wind turbine is often equipped with a transformer stepping up the generator terminal voltage, usually a voltage below 1 kV (E.g. 575 or 690 V), to a medium voltage around 20-30 kV, for the local electrical connection within a wind farm (distribution level).

How to calculate the output power of a wind turbine?

Multiplying these two values produces an estimate of the output power of the wind turbine. Below you can find the whole procedure: 1. Sweep area of the turbine. Before finding the wind power, you need to determine the swept area of the turbine according to the following equations: For HAWT: A = ? \times L^2 A = ? × L2 For VAWT:

How many homes can a wind turbine power?

The world's biggest offshore wind turbines can now make 13 megawatts, since they can be built much taller and winds are stronger and more persistent out at sea. If a 2MW turbine can power 1000 homes, simply scaling up the numbers, you'd expect a 13MW turbine to be able to power about 6500 homes.

How to calculate wind power?

Below you can find the whole procedure: 1. Sweep area of the turbine. Before finding the wind power, you need to determine the swept area of the turbine according to the following equations: For HAWT: A = ? \times L^2 A = ? × L2 For VAWT: A = D \times H A = D × H where: H H -- Turbine height. 2. Calculate the available wind power.

How do wind turbines produce electricity?

Wind is created by the unequal heating of the Earth's surface by the sun. Wind turbines convert the kinetic energy in wind into mechanical power that runs a generator produce clean electricity. Today's turbines are versatile modular sources of electricity.

The turbine generator voltage is normally classed as "low", in other words below 1,000 V, and is often 690 V. Some larger turbines use a higher generator voltage, around 3 kV, but this is not high enough for economical direct interconnection ...
