

# How to repair the leakage of photovoltaic inverter

Can a transformer-less inverter cause DC current leakage?

In photovoltaic systems with a transformer-less inverter, the DC is isolated from the Ground. Modules with defective module isolation, unshielded wires, defective power optimizers, or an inverter internal fault can cause DC current leakage to the Ground (PE - protective earth). Such a fault is also called an isolation fault.

How to fix a solar inverter failure?

To address the isolation problems, make sure the DC cables are high quality; the connections are all watertight. Install the connections with care so that it doesn't come in contact with humidity. When the solar system encounters a grid fault, the inverter should be able to restart on itself after it comes online.

Why does my solar inverter need repair?

Solar inverters are the heart of any photovoltaic (PV) system, converting the direct current (DC) generated by solar panels into alternating current (AC) that can be used to power household appliances or fed back into the grid.

How do I repair a solar inverter?

To repair a solar inverter, first, you need to diagnose the problem, which is often indicated by the error code displayed on your inverter's LCD screen. Once the issue is identified, refer to the inverter's manual or consult the manufacturer's technical support.

How do I know if my solar inverter needs repair?

Determining whether your solar inverter requires repair involves a combination of observation, testing, and troubleshooting. Signs that your inverter may be malfunctioning include: Error Messages: Displayed error codes or warning lights indicate a fault or operational problem.

When should you troubleshoot or fix a PV inverter?

An inverter with a PV system should chug away a few years without any major issues. But you may face problems with the system even before it's a long time. Here are the things you should know when you have to troubleshoot or fix your PV inverter:
