What is energy storage performance testing?

Performance testing is a critical component of safe and reliable deployment of energy storage systems on the electric power grid. Specific performance tests can be applied to individual battery cells or to integrated energy storage systems.

What is the power of a storage system?

The power of a storage system, P , is the rate at which energy flows through it, in or out. It is usually measured in watts (W). The energy storage capacity of a storage system, E , is the maximum amount of energy that it can store and release. It is often measured in watt-hours (Wh). A bathtub, for example, is a storage system for water.

How do you calculate energy storage capacity?

Specifically, dividing the capacity by the power tells us the duration, d , of filling or emptying: $d = E/P$. Thus, a system with an energy storage capacity of 1,000 Wh and power of 100 W will empty or fill in 10 hours, while a storage system with the same capacity but a power of 10,000 W will empty or fill in six minutes.

What is energy storage performance?

Performance, in this context, can be defined as how well a BESS supplies a specific service. The various applications for energy storage systems (ESSs) on the grid are discussed in Chapter 23: Applications and Grid Services. A useful analogy of technical performance is miles per gallon (mpg) in internal combustion engine vehicles.

Are energy storage systems suitable for grid applications?

Toward that end, we introduce, in two pairs, four widely used storage metrics that determine the suitability of energy storage systems for grid applications: power & capacity, and round-trip efficiency & cycle life. We then relate this vocabulary to costs. The power of a storage system, P , is the rate at which energy flows through it, in or out.

How are grid applications sized based on power storage capacity?

These other grid applications are sized according to power storage capacity (in MWh): renewable integration, peak shaving and load leveling, and microgrids. BESS = battery energy storage system, h = hour, Hz = hertz, MW = megawatt, MWh = megawatt-hour.
