

Should you use a microgrid to power your home?

Areas prone to power outages, whether through hurricanes or frequent storms, benefit from microgrids. Homeowners are encouraged to be safe and stay inside, versus leaving their home to find locations with power. Homes can be exclusively powered by microgrids as well, without any dependence on power companies.

What is a microgrid & how does it work?

What Are Microgrids? A microgrid is a local energy grid. It's located on your property and is connected to your traditional power grid, which delivers the energy for powering your home. Power outages, however, disrupt that delivery. Microgrids, in response, automatically disconnect from the traditional grid and begin powering your home.

Is a solar microgrid a good idea?

Luckily, there's another way. A solar microgrid allows you to generate your own clean power -- both during an emergency and on a day to day basis. It's a green, silent, and surprisingly economical way to provide backup power for your family during the next power shutoff -- or during an unplanned outage following an earthquake.

Should I buy a DIY microgrid?

If you have more modest power needs, you rent your home/apartment, or you don't want the cost of a professional microgrid, a DIY option may be the best bet. Most DIY microgrids are totally separate from the main grid -- they don't use net metering, and in many cases are not even attached to your home.

What is a grid-connected microgrid?

Grid-connected microgrids are systems that operate with the main power grid. They can draw power from the grid, supply excess power back to the grid, or function autonomously during grid outages. These systems typically include a combination of renewable energy sources, such as solar or wind, along with energy storage solutions such as batteries.

Can you earn money from a microgrid?

Homeowners can earn money, as well as tax credits, for microgrids. If your microgrid uses renewable energy, you can take advantage of the Residential Renewable Energy Tax Credit, which benefits solar, wind and geothermal energy systems. Power companies also buy excess power from homeowners, especially clean or green energy.

A collection of these microinverters on a house can act as a microgrid. Each one contains a chip that--when the main power grid suffers a power failure--switches from an on-grid to an off-grid mode.
