

How does the ice bank work?

The idea behind the Ice Bank is simple: at off peak electricity hours, such as at night, ice is generated on the plates with our Laser Plate technology. This ice is then used during the day to cool your product. We call this thermal energy storage.

What are ice bank model C tanks?

Ice Bank model C tanks are second generation thermal energy storage. They come in different sizes to accommodate differing space constraints and offer a significant benefit-- tanks can be bolted to each other due to their modular, internalized main headers. That means less distribution piping is needed.

What is an ice bank?

An ice bank is a package of Laser Plates that is hung in a container with water. At night when the energy is at a lower price, the plates freeze the water in the tank. During the day when the power is more expensive, the cooler is turned off. The ice will melt into ice water. This ice water can be used to indirectly cool your products.

How long does it take to charge an ice bank tank?

A full charging cycle of an Ice Bank tank takes about 6 to 12 hours, depending upon the job criteria. During the peak-load discharge cycle the following day (see Discharge Cycle), the glycol solution leaving the chiller is 52°F, where chiller operation is more efficient than a conventional chiller systems' requirement of 44°F.

What material is the ice bank made of?

The Ice bank is made of stainless steel, such as 304, 316, SMO-254 and Duplex 2205. Contact us to learn about different product variations, materials & heat transfer mediums! High peak loads in the summer drive the investment expenditure of the electricity production industry.

What cooling mediums can I use with my ice bank?

Almost all cooling or heating mediums can be used with our Ice Banks, such as R717, CO2, Propylene Glycol, Ethylene Glycol, and Freon refrigerants. If you need more information about other cooling mediums, please email one of our engineers.
