Room temperature sodium-sulfur (Na-S) batteries, known for their high energy density and low cost, are one of the most promising next-generation energy storage systems. However, the polysulfide shuttling and uncontrollable Na dendrite growth as well as safety issues caused by the use of organic liquid electrolytes in Na-S cells, have severely hindered their ...

Sodium-metal batteries (SMBs) are an appealing sustainable low-cost alternative to lithium-metal batteries due to their high theoretical capacity (1165 mA h g⁻¹) and abundance of sodium. However, the practical viability of SMBs is challenged by a non-uniform deposition and uncontrollable growth of dendrites

Therefore, durable Na electrodeposition and shuttle-free, 0.5 Ah sodium-sulfur pouch cells are achieved at -20 °C, for the first time, surpassing the limitations of typical LHCEs. This tailoring strategy opens a new design direction for advanced batteries operating in fast-charge and wide-temperature scenarios.
