

What is a photovoltaic power plant?

In addition to photovoltaic panels, a solar power plant contains mounting structures, tracking systems, batteries and power electronics (inverter, controller and grid connection equipment). Everyone knows that photovoltaic systems convert solar energy into electricity. However, few people know the interesting origin of the term "photovoltaic".

What is the US large-scale solar photovoltaic database?

The U.S. Large-Scale Solar Photovoltaic Database provides the locations and array boundaries of U.S. ground-mounted photovoltaic facilities, with capacity of 1 megawatt or more.

How are solar photovoltaic power plants monitored?

Currently, solar photovoltaic power plants are monitored by electronic data acquisition, monitoring and control (SCADA) systems. These systems are used for various purposes and may differ significantly in their technical characteristics. Monitoring is necessary for operators to identify emergencies at a solar power plant.

What is a solar photovoltaic system?

This type of solar photovoltaic system eliminates the need for costly storage batteries, although connecting to the mains can be difficult. According to the current legislation of a number of European countries, electric companies are obliged to buy solar energy at preferential prices.

What are the different types of photovoltaic cells?

Photovoltaic cells come in a variety of types and sizes, from postage stamps to panels that span tens of square meters. Photovoltaic cells connected together form solar modules. The modules, in turn, can be combined and connected to form photovoltaic systems of different sizes and power outputs.

What is a large photovoltaic system?

Large photovoltaic systems are usually equipped with a communications infrastructure that allows the operator to monitor and control energy production in real time. This infrastructure can be used to detect damage to individual photocells and simplify maintenance.
