Can a wind turbine be connected to a utility grid?

Whether or not your wind turbine is connected to the utility grid, the installation and operation of the wind turbine is probably subject to the electrical codes that your local government (city or county) or in some instances your state government has in place.

How long should a wind turbine be connected?

In the United States, the Western Electricity Coordinating Council (WECC) grid code requires that the wind turbine remain connected under the voltage of 1.2 p.u. for 1 second. Note: V_{max} = maximum voltage; T_{max} = maximum time; ms = milliseconds. For system restoration under HVRT, it is imperative to have dynamic grid support during voltage swell.

Can a Type 3 turbine provide stability to the bulk power grid?

The demonstration at NREL using GE's controls showed that the popular type-3 turbine technology can supply fundamental stability to the bulk power grid. Such grid-forming controls could allow the turbine to make up for fewer conventional sources of stability on the grid, such as coal or natural-gas-fired generators.

Can wind turbines serve the same underlying voltage and frequency stability?

"We have shown that a common variety of wind turbine can serve the same underlying voltage and frequency stability services that are often provided by fossil fuel power plants," said NREL Chief Engineer Vahan Gevorgian.

Are solar PV and wind turbine generators based on inverters?

All solar PV and all large wind turbine generators are based on power electronic inverters. These inverters have different technical characteristics than the synchronous generators used in conventional power plants, which have an inherent electro-mechanical link to the grid.

How do wind turbines generate electricity?

Wind turbines generate electricity using active wind turbine controls (blade pitch, turbine yaw) that maximize the generation output while providing power factor (or voltage) control. An underground network of feeders (typically 34.5 kV) connects the wind turbines to the substation. The electricity generated by wind turbines goes through an AC-DC-AC converter before being connected to the grid, which can be a Doubly Fed Induction Generator (DFIG) or a Synchronous Generator.
