

How does a PV inverter state machine work?

The inverter state machine then sequences to checking for DC voltage. To feed current into the grid the DC voltage (which in case of PV inverters is provided from the panel or panel plus some conditioning circuit), it must be greater than the peak of the AC voltage connected at the output of the inverter.

What is a solar panel inverter demo?

The main task for this solar panel inverter demo is to present the MPPT feature. For this reason the DC-bus voltage low limit is moved to a low level, about 25 V AC. It is possible to show the output power variation from the solar panel through its dependence on rapidly changing illumination conditions.

What is a photovoltaic (PV) panel?

The solar panel or PhotoVoltaic (PV) panel, as it is more commonly called, is a DC source with a non-linear V vs I characteristics. A variety of power topologies are used to condition power from the PV source so that it can be used in variety of applications such as to feed power into the grid (PV inverter) and charge batteries.

How many solar panels can a solar inverter power?

The nominal input voltage is 36 V DC. Therefore, one solar panel with an output voltage of 36 V, or two solar panels each of 18 V connected in series can be used as the power source for the inverter. For demonstration purposes, the nominal output power of the solar panels can vary from about 50 W up to 200 W per panel.

How is DC output power sourced from a solar panel calculated?

The DC output power sourced from the solar panel is periodically computed. The P&O algorithm for the MPPTT is applied, (see Figure 2-3). This method is based on the simple and effective P&O algorithm. In the one power point P1, you can try to sink higher power from the solar panel by increasing the current from the panel.

Can a solar inverter work with a DC power supply?

The inverter can work with the standard DC power supply used as the power source, instead of the solar panel. The power supply has to meet the specification of the 30 V DC output voltage and a 4 A max output current. When the DC power supply is used, the MPPT feature does not function.
