

Why are PV inverters able to supply more short circuit current?

In principle the PV inverters are able to supply more short circuit current during fault scenarios than only 1 p.u. reactive current due to current reserve margin of the inverter system. The control is able to limit the current injection during faults to the nominal but also to an overload current limitation of the generation system.

What happens if a photovoltaic inverter fails?

Grid failures may cause photovoltaic inverters to generate currents ("short-circuit currents") that are higher than the maximum allowable current generated during normal operation. For this reason, grid operators may request short-circuit current ratings from vendors in order to prepare for failure scenarios.

Why are PV inverters required during a short-circuit fault?

During the short-circuit fault, the PV inverters are required to provide the grid-voltage support required by the grid codes. It is assumed that the fault can be detected instantaneously and a fault signal is generated.

Are PV inverters purely reactive current sources?

In particular, in the calculation following the IEC 60909 standard, each PV inverter is modeled as a current source that injects purely reactive current with the full capacity. The obtained results are shown in Fig. 7 for comparison.

What is a short-circuit analysis of grid-connected photovoltaic power plants?

This paper presents a short-circuit analysis of grid-connected photovoltaic (PV) power plants, which contain several Voltage Source Converters (VSCs) that regulate and convert the power from DC to AC networks. A different methodology has been adopted in this paper for short-circuit calculation.

Can power converters be modeled as current sources for short-circuit calculation?

This traditional equivalent has failed to represent the power converters' control mode in the studied system. The IEC 60909 standard established that converter-based generating units can be modeled as current sources for short-circuit calculation.

power converter depends on the size of the PV inverters. Most PV inverters in the low power level (less than 10 kW) are usually configured as a single-phase inverter (up to 240V for residential) ...
