How do solar photovoltaic cells work?

Solar photovoltaic cells are grouped in panels, and panels can be grouped into arrays of different sizes to power water pumps, power individual homes, or provide utility-scale electricity generation. Source: National Renewable Energy Laboratory (copyrighted)

Why should you install solar panels on your home?

By producing clean electricity for consumption on-site, solar installations can decrease your dependence on grid-supplied power, leading to lower energy bills and the opportunity to reduce your home's carbon footprint.

How does the photovoltaic effect occur?

The photovoltaic effect occurs when photons from the sun's rays hit the semiconductive material (typically silicon) in the cell of the solar module. The photons activate electrons, causing them to free themselves from the semiconductive material. Photons hit the solar panel causing electrons to be freed during the photovoltaic effect.

How many PV panels are in a PV array?

A PV array can be composed of as few as two PV panels to hundreds of PV panels. The number of PV panels connected in a PV array determines the amount of electricity the array can generate. PV cells generate direct current (DC) electricity. DC electricity can be used to charge batteries that power devices that use DC electricity.

Can a polycrystalline solar panel be used on a roof?

Alternatively, a lower-cost, slightly less efficient, polycrystalline panel may do the job just as wellif you have ample roof space on your home. Many panel manufacturers also build panels containing both mono and polycrystalline wafers to form solar cells, capable of harvesting energy from a wider spectrum of light.

Are PV systems grid-connected?

Since 2004,most PV systems in the United States are grid-connected--they are connected to an electric power grid. These PV systems are installed on or near homes and buildings and at utility-scale power plants that have at least 1 megawatt of electric-generation capacity.

A solar panel, or solar module, is one component of a photovoltaic system. They are constructed out of a series of photovoltaic cells arranged into a panel. They come in a variety of rectangular shapes and are installed in combination to ...

At the heart of a solar panel's ability to generate electricity is the photovoltaic (PV) effect. Discovered in 1839 by French physicist Edmond Becquerel, the PV effect is the process by which solar cells within the panel ...
