How does a photovoltaic system work?

The heart of a photovoltaic system is the solar module. Many photovoltaic cells are wired together by the manufacturer to produce a solar module. When installed at a site, solar modules are wired together in series to form strings. Strings of modules are connected in parallel to form an array.

Do PV solar plants use ground mounting systems?

PV solar plants use ground mounting systems of solar panels. The advantage of the ground mounting system, as compared to the roof-based solar panels systems, is that no two roofs are exactly alike, which significantly limits the possibilities of standardization.

Should a general contractor install a solar PV system?

A general contractor may face a choice between using an electrical subcontractor or a solar subcontractor to install the PV system. A good solar contractor will have the expertise in solar PV systems plus qualified electricians on staff.

How does a PV system work?

A PV system works in a remarkably simple and efficient way. When sunlight hits the solar cells in a PV system, it excites the electrons in the cells and generates a flow of electric current. This process is known as the photovoltaic effect. Each solar cell is a small sandwich of semi-conductive material, typically silicon.

Is a solar power plant a conventional power plant?

The solar power plant uses solar energy to produce electrical power. Therefore, it is a conventional power plant. Solar energy can be used directly to produce electrical energy using solar PV panels. Or there is another way to produce electrical energy that is concentrated solar energy.

Can a solar panel connect with AC power?

The block diagram of this system is shown in the figure below. The output of the solar panel is in the form of DC power. Hence, DC load can directly connect with the solar system. But if you need to connect the AC load, the inverter is necessary to convert the DC power into AC power. Generally, this plant is connected with other AC sources also.
