Will snow and ice affect photovoltaic electricity generation?

Snow and ice may form almost anywhere on Earth's surface in rare cases, but only in certain regions will it happen frequently enough to have any significant impact on photovoltaic electricity generation.

Are photovoltaic cells a viable source of energy in winter?

While the solar radiation in these regions is of comparatively low intensity, and energy production will be greatly reduced during the winter, photovoltaic cells remain a viable source of energy for parts of the year.

Are photovoltaic panels a good option for low-energy buildings?

It has been demonstrated that buildings outfitted with photovoltaic panels can achieve a net surplus of energy over its lifetime, even as far as 60 degrees north (Fjeldheim et al., 2015). For this reason, photovoltaic panels have become a popular feature on low-energy buildings.

How does snow affect the optical properties of a snow pack?

At snow depths lower than the thickness of the active layer, the optical properties of the snow pack will be influenced by its underlying surface. This active layer has a higher extinction coefficient than the deeper snow, resulting in a more rapid extinction of solar radiation passing through it.

Who developed solar reflectance and transmittance of snow cover?

Dunkle and Bevan produced their "...approximate analysis of the solar reflectance and transmittance of a snow cover" in 1956, where mathematical models for radiation reflection and transmission were presented. Later, Giddings and LaChapelle (1961) elaborated on energy distribution and albedo of snow.
