Could transparent solar cells turn everyday products into power generators?

MIT researchers are making transparent solar cells that could turn everyday products such as windows and electronic devices into power generators--without altering how they look or function today. How? Their new solar cells absorb only infrared and ultraviolet light.

What is a transparent solar cell?

Transparency is a physical property that allows light to pass through without interrupting it. The core of this research is transparent solar cell (TSC) and its use in many applications that require optically transparent solar cells, such as car windows. What makes a material transparent is the arrangement of atoms and electrons in it.

Can PBS QD be used in semi-transparent heterojunction solar cells?

In addition, PbS QD has a transparent property that can be used in semi-transparent heterojunction solar cells. A semi-transparent solar cell (SCQDSCs) is fabricated on transparent FTO glass, combining TiO₂ film as an electron transporting layer (ETL) and an MoO₃ film as a hole transporting layer (HTL).

Can transparent solar cells power a building?

Building integrated photovoltaics, also known as BIPV, is the nearest application for transparent solar cells. If all the buildings with 90% glass on their surface used transparent solar cells printed on the surface of the glass, the solar cells have the potential to power more than 40% of that building's energy consumption.

Are transparent solar-harvesting systems a good idea?

Integrating transparent solar-harvesting systems into windows can provide renewable on-site energy supply without altering building aesthetics or imposing further design constraints. Transparent photovoltaics have shown great potential, but the increased transparency comes at the expense of reduced power-conversion efficiency.

Can a transparent photovoltaic cell compete with today's solar cells?

Inventing a new solar technology that can compete commercially with today's solar cells is difficult, given existing deployment methods. But a transparent photovoltaic (PV) cell would change the rules of the game. It could be deposited on any surface without obscuring the look of the underlying material.
