SOLAR PRO. String photovoltaic inverter tester

How do I test a photovoltaic (PV) inverter?

Keysight's photovoltaic (PV) simulator includes the hardware and software to test a single maximum power point tracking (MPPT) inverter accurately. Test PV voltages up to 2000 V and 60 A with a single supply. DG9000 Series software licenses are available to test string inverter with 4-, 8-, or 12-MPPT channels.

What is a PV string current test?

For PV string current tests, there are short-circuit and operational current tests. The short-circuit current of a string, Isc is the current that flows when the positive and negative terminals of the string are shorted together, and is the maximum current value of the string.

Can a dg9000 test a string inverter?

Test PV voltages up to 2000 V and 60 A with a single supply. DG9000 Series software licenses are available to test string inverter with 4-, 8-, or 12-MPPT channels. Most string inverter solutions test one MPPT channel at a time -- leading to test inaccuracies.

How do you calculate PV string voltage?

The PV string voltage is calculated by multiplying the module Voc by the number of modules in series. Isolate the equipment to be tested. Open (turn off) the load break rated disconnect in the section where you're working -- this may be a specific area or every disconnect in the array.

How do I check if a PV meter is working?

Use a current clamp, like the Fluke 393 FC Solar Clamp Meter, to verify zero current in each PV circuit string before opening the fuse holders. Verify that no current is present, then open the touch-safe fuse holders to isolate each PV circuit string. Warning: Never measure current in a PV installation with the probe tips of a multimeter.

How many volts can a solar utility Pro Test?

Its market leading 40A current capability enables the Solar Utility Pro to test parallel wired strings up to a maximum of 1500V/40A, eliminating the time consuming task of separating strings to keep within lower limits of other instruments.
