

Summary of the Microgrid Technology Special Report

What is Microgrid technology?

Microgrids are the most effective application form of integrated energy. The coordinated optimization of multiple energy sources such as electricity, gas, and heat in a local area is the basis for comprehensive energy development. Microgrid technologies, coupled with Internet technologies, can realize the development of regional "energy Internets".

What is a microgrid report?

This report provides (1) an overview of the microgrid planning, assessment, and design process for DoD installations and (2) is a resource for energy managers, policymakers, contractors, and other stakeholders involved in microgrid projects.

What technical challenges did the microgrids project face?

Similar technical challenges were explored by the European Union MICROGRIDS project such as energy management, safe islanding and re-connection practices, protection equipment, control strategies under islanded and connected scenarios, and communications protocols.

How does government support microgrids?

Support for microgrids comes from research and development (R&D) programs at federal and state levels, software and tools, grants and funding support to incentivize demonstration projects, and tax and financial incentives for the installation of distributed energy [2, 3, 6, 126].

Where did research on Microgrid technology start?

Research on microgrid technologies started relatively late in China. Compared with the huge research teams composed of research institutions, manufacturers and power companies in developed countries and regions such as Europe, the United States, and Japan, there is still a big gap in research strength and research results in China.

What are the benefits of a microgrid?

In grid connected operations they can provide cost savings. When microgrids are operated under contingency scenarios, renewable energy provides a generation source that does not require refueling. Because of this benefit, renewable resources are often seen as offsetting other generation sources that require refueling.
