Are microgrids a key component of the smart grid?

Microgrids have been identified as a key component of the Smart Grid for improving power reliability and quality, increasing system energy efficiency, and providing the possibility of grid-independence to individual end-user sites.

Will grid-tied microgrid customers stay connected if the grid fails?

Although grid-tied microgrid customers will likely stay connected to the grid for the foreseeable future, only islanding in the case of utility grid failure, self-consumption of microgrid generated energy could erode the revenue base that has traditionally paid for utility infrastructure investments.

Do utility companies have a process for interconnection of microgrids?

Utility companies generally do not have a process for interconnection of microgrids, and this can be challenging, as the utility company may be unsure of how to proceed with microgrid related projects or who within the utility is responsible for approval of the project interconnection agreement.
