

Vietnam: Many of us want an overview of how much energy our country consumes, where it comes from, and if we're making progress on decarbonizing our energy mix. This page provides the data for your chosen country across all of the key metrics on this topic.

Vietnam: Many of us want an overview of how much energy our country consumes, where it comes from, and if we're making progress on decarbonizing our energy mix. This page provides the data for your chosen country across ...

The report shows how Vietnam through the expansion of renewable energy, along with electrification of the industry and transport sectors, can secure a cost-efficient green transition and reach its target of net-zero emissions by 2050, while reducing Vietnam's dependence on energy imports.

Energy supply. Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country. Some of these energy ...

Vietnam has a diverse energy fuel resource of various types such as coal, natural gas, petroleum, hydropower and renewables such as solar and wind energy. The country has recently been successful in renewable energy deployment, especially solar and wind power development. [1]

Energy supply. Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country. Some of these energy sources are used directly while most are transformed into fuels or electricity for final consumption.

From 2020 to 2030, fuel imports will increase by 3, and by 2050, it will be 8 times higher than at present. This shows that three-fourths of Vietnam's energy consumption is from imported energy. Therefore, Jakob Stenby Lundsager proposed, Vietnam will soon study the reduction of future coal demand and take early action in coal power consumption.
