What is a smart grid & why is it important?

Electronic power conditioning and control of the production and distribution of electricity are important aspects of the smart grid. The smart grid represents the full suite of current and proposed responses to the challenges of electricity supply.

What is the net frequency of a power grid?

Some regions are using power grids with a net frequency of 60 Hz, which means that they complete 60 cycles per second. In this article, we use for our considerations IEC regulations with a net frequency of 50 Hz. Historically, there was no need to control the net frequency, but the principle is the same.

What are the three main functions of a power grid?

The operation of the power grid can be broken down into three primary functions: generation, transmission, and distribution. Generation is the process of producing electrical power. It occurs in power plants, which can use a variety of energy sources, including fossil fuels, nuclear energy, and renewables like wind, solar, and hydroelectric power.

Did Texas have a power grid?
