

Can wind power integrate with energy storage technologies?

In summary, wind power integration with energy storage technologies for improving modern power systems involves many essential features.

How to suppress wind power fluctuation in a wind farm?

In the process of suppressing wind power fluctuation in the wind farm, when the original output of the wind farm  $P_W(h)$  is greater than the grid-connected target value  $P_{ref}(h)$ , that is,  $P_W(h) > P_{ref}(h)$ , the combined system of self-built energy storage and leased energy storage charges.

Why is energy storage important in wind farms?

In wind farms, the energy storage system can realize the time and space transfer of energy, alleviate the intermittency of renewable energy and enhance the flexibility of the system. However, the high cost limits its large-scale application.

Are secondary and flow battery technologies necessary for offshore wind farms?

Techno-economically feasible secondary and flow battery technologies are required to enable future offshore wind farms with integrated energy storage. The natural intermittency of wind energy is a challenge that must be overcome to allow a greater introduction of this resource into the energy mix.

How CES can help a wind farm?

The CES operator can aggregate idle energy storage capacity and invest in a portion of centralized energy storage devices to provide energy storage leasing service. Wind farms can lease CES to suppress wind power fluctuations, which brings new problems of energy storage capacity configuration.

Do wind farms need energy storage capacity?

Considering the economic benefits of the combined wind-storage system and the promotion value of using energy storage to suppress wind power fluctuations, it is of great significance to study the optimal allocation of energy storage capacity for wind farms.
