What is explosion-proof wiring?

This is the principle behind explosion-proof wiring. Even if the circuit did ignite a quantity of hazardous mixture, the wiring container, can "contain" the resulting explosion and cool any escaping hot gasses so that they would be incapable of igniting the hazardous mixture outside of the explosion-proof container.

What is the maximum internal pressure in the EXpressure enclosure?

The maximum internal pressure in the EXpressure enclosure amounts to less than 1 bar. As a result, it provides protection with a significantly reduced wall thickness. Owing to these changes in design, you have more installation space available. What makes EXpressure revolutionary?

How many threads does an explosionproof enclosure need?

It must be made up wrenchtight and have five threads fully engaged where connected to explosionproof enclosures. Some listed explosionproof enclosures may require only 4 threads fully engaged because of the factory provided NPT entries; these are recognized by exception to the general requirement.

Is UL 1203 explosionproof?

The product standard used to evaluate these is UL 1203 Explosionproof and Dust Ignitionproof Electrical Equipment for Use in Hazardous (Classified) Locations. Fittings available in the marketplace are either listed as explosionproof or not listed as explosionproof.

Are the fittings available in the marketplace explosionproof?

Fittings available in the marketplace are either listed as explosionproof or not listed as explosionproof. Unless the marking is visible after installation, it may not be obvious whether the fittings meet the requirements of the product standard.

How do EXpressure cabinets work?

REINVENTED! The new EXpressure cabinets are revolutionising the science of explosion protection. They are equipped with grids made from stainless steel wire mesh in the walls through which pressure flows in the event of an explosion. The wire mesh absorbs the heat energy and the pressure dissipates.
